

Car Maintenance Tracker **(nxtfix)**

My app idea is a Car Maintenance Tracker. This app would help people keep track of car maintenance so they do not forget important services like oil changes, tire rotations, or brake checks. The main purpose of the app is to help users stay organized with their vehicle care. A lot of people forget when they last changed their oil or how many miles are on their car. This app would give them one place to save that information and check what maintenance is coming up next. The app would let the user enter information about their car, such as the make, model, year, and current mileage. The user could also add maintenance records, including the type of service, the date it was done, and the mileage at that time. The app would then show a history of past services and let the user know when a service is due soon. The audience for this app is everyday drivers. It could be helpful for anyone who owns a car and wants an easy way to remember maintenance tasks. The app would be used by opening it and entering vehicle information first. After that, the user could add service records each time work is done on the car. The app would show the saved records and compare the current mileage to the mileage of the last service. If something is due soon, the app would display a reminder. For example, a user could enter that their car has 60,000 miles on it. Then they could record that they got an oil change at 58,000 miles. If oil changes are needed every 5,000 miles, the app would show that the next oil change is due at 63,000 miles. This helps the user know how close they are to the next service. For now the app will remain relatively basic and consist only of the most frequently needed services broken down to the most minimalistic math possible. That way it's still ready for class presentation if I don't have time to finish everything I'd like to. The idea is to have the app be able to track the life span of an engine, transmission and other various important parts that need regular maintenance or replacement. If there is a problem with a users car, the app will be able to tell the user what the issue could be based on the users record as well as give the user a step by step on how to fix the issue themselves, videos to help demonstrate the solution, and registered mechanics/tow companies near them with options to sort by either closest, top rated, or best priced. In the end, the user will be asked to rate the chosen companies, leave a comment regarding their experience as well as any final costs to help keep the market honest, and to rate the overall experience they have had using the app so far.
